Easy On Off Contactlens tool

Thanks to the Easy On Off's lenstool, the daily routine of contact lens handling has been made easier for many of our contact lens wearers. For some of them, this tool makes the difference between good vision with special lenses or remaining visually impaired with spectacles!

The Easy On Off tool has several innovative benefits:

- The tool is bigger and easier to hold than competitive products.
- It is easier to create good suction to the lens, due to the design of the bladder.
- The bladder is decentred, to allow for a better view towards a mirror when removing a lens.
- The stand used for inserting the contact lens is unique as it lets air go through the tool so that the lens does not stick to the tool when inserting it into the eye.
- The stand has a mirror so that light from a pentorch can be sent through the tool. It makes it easier to insert the lens to the center of the eye, and it avoid having electrical components mounted into the tool that would easily be damaged by lens solutions

Our experience is that the tool makes handling contact lenses easier for many contact lens users, and that it provides significant improvements compared to the alternatives in the market.

Best Regards
